

## DRUG INSPECTION SYSTEM

### Abstract

Drug Audition & Research Management is a system that practically concentrates on the associative standards of the Medical diagnosis and Research Developments environments. The major problem in Drugs and pharmaceuticals industry is to design or invent a new Bio-molecular combination of a chemical. The new Bio molecular combination should have the ability in training its roots towards the ailment that exists in the body and fight against that ailment. In the initial stages while the drug is under the preparatory stages of experiment, it is combinationally checked on some of the living organisms, which belong to the species of mammals. Once the drug trial experiments come to a proper status on these animals to have precision check and reliability standards, they are once again checked upon the human beings who are physically associated to such problems. The individuals who are suffering through proper ailments are recognized and they are requested to participate in the Drug trials voluntarily. The participation of the individuals is governed through the Byelaws and legal procedures that exist under the human and civilian rights of the constitution governed by the European Union. The application increases in its size through the database, as the research activity increases within the organization. At a specific time the search of required information takes a great lot of time the search of required information takes a great lot of time and costs the organization both in time and money.
