ATM REPORT GENERATION

ABSTRACT

The project entitled "ATM Report Generation" has been developed using Asp.Net using C#.Net as front end and SQL Server as back end.

The main objective of this project is reporting application based on an existing client/database application. The existing application gathers all the transaction data from different ATM machine”. The goal of the application is to allow manager to view general reporting information through a web browser and not require the installation of the client or exhaustive training.

The scope of this application is 4 graphical reports, a security module. Which are ATM availability, Transaction types and volume, on-us and not on-us transactions, Average withdrawal amounts etc., the reports will primarily be accessing data in the transaction log which contains most of the prevalent information for managers for me to develop a prototype system that then could be modified by them to suit the specific needs of the forest manager in the future.
